# INTRODUCTION

# Introduction

- The use of fossil fuel in the past century has drastically increased CO<sub>2</sub> emission into the atmosphere.
- Approximately two-thirds of proven fossil fuel reserves need to remain un-extracted and CCS technology deployed for the world to achieve the 2 °C goal by 2050

# Introduction

- CO<sub>2</sub> EOR and CCS are processes that get rocks exposed to CO<sub>2</sub>
- When CO<sub>2</sub> is injected into the shale layers:
- It dissolves and changes the acid-base equilibrium that triggers the dissolution and precipitation of minerals
- As a result of dissolution, flow channels can be formed in the rock, which will eventually alter the intrinsic permeability and porosity of the rock.

# Why Gas Adsorption

---

# Pore structure characterization of shale

- Pore structure evaluation
  - Gas adsorption ( $N_2$  and  $CO_2$ )
  - mercury intrusion porosimetry (MIP)
  - small angle neutron scattering (SANS),
  - ultra-small angle neutron scattering (USANS)
  - nuclear magnetic resonance (NMR)
- Direct observation methods:
  - field emission scanning electron microscopy (FE-SEM)
  - atomic force microscopy (AFM)
  - microfocus X-ray computed tomography (u-CT)
  - transmission electron microscopy (TEM).

# Pore structure characterization of shale

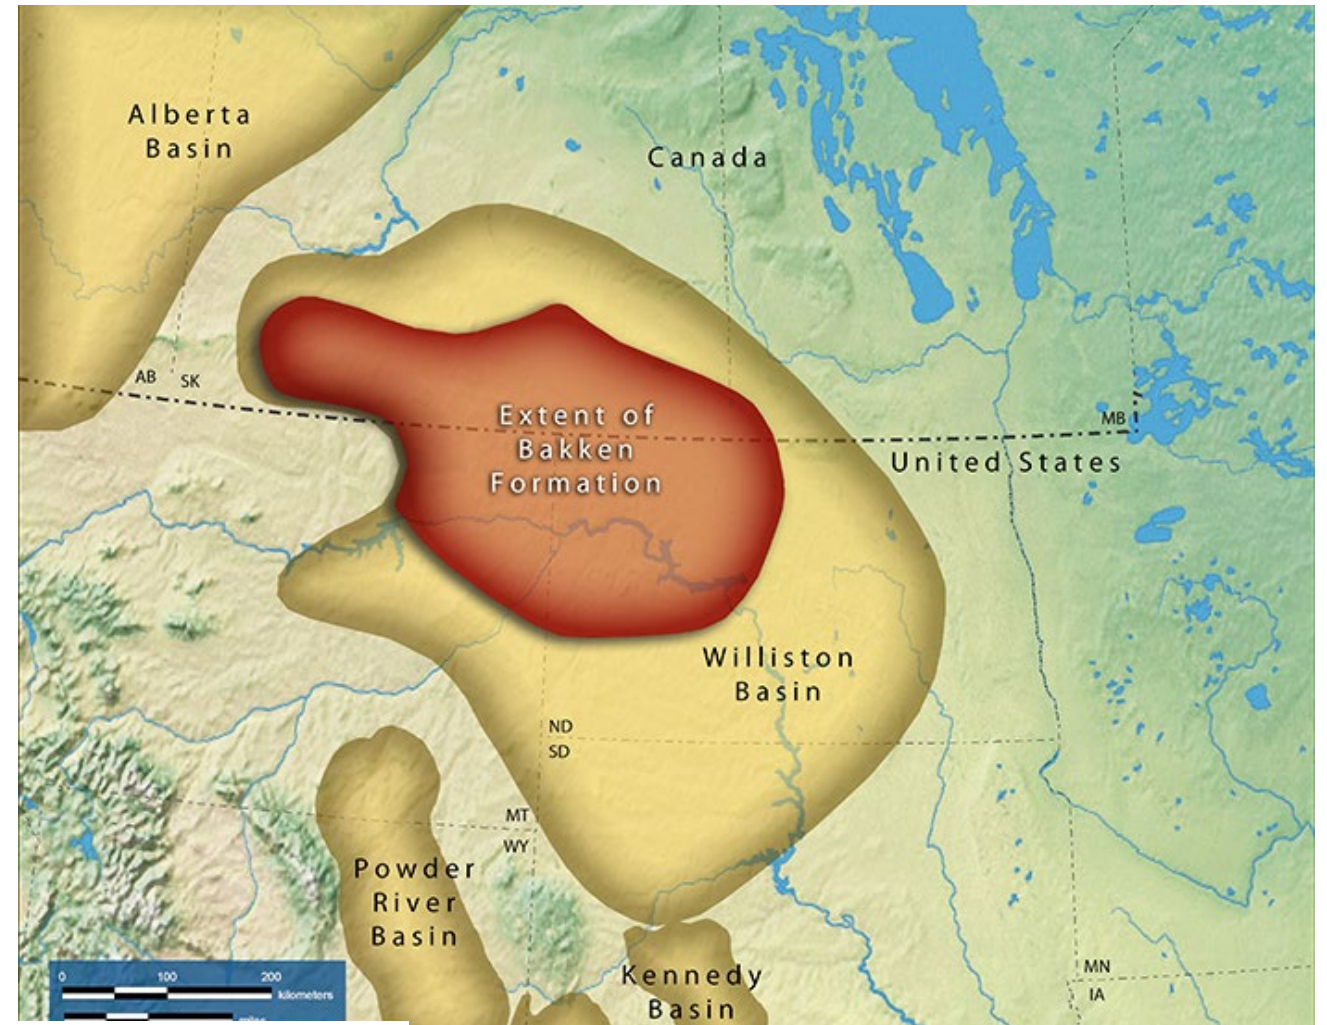

- Gas adsorption ( $N_2$  and  $CO_2$ )
  - Obtain an entire spectrum of pore size distribution (PSD) from submicron to the macroscale
  - Physisorption isotherm type: I(a), I(b), II, III, IV(a), IV(b), V and VI
  - Hysteresis loop pore shape categories used to determine the morphology of the pore structure: H1, H2(a), H2(b), H3, H4 and H5

# THE BAKKEN

# The Bakken

- Major unconventional play in the Williston Basin
- Consist of the upper, middle and lower members
- Upper and lower member are dark marine shale with organic content (source and seal rock in the Bakken)
- Middle member is a middle fine-grained combination of clastic and carbonates
- Heterogenous and anisotropic

# The Bakken

- Major unconventional play in the Williston Basin
- Consist of the upper, middle and lower members
- Upper and lower member are dark marine shale with organic content (source and seal rock in the Bakken)
- Middle member is a middle fine-grained combination of clastic and carbonates
- Heterogenous and anisotropic

Mississippian

Devonian

Upper Bakken shale Member

Middle Bakken  
mixed carbonates  
siliciclastic member

Lower Bakken shale member

# METHODS

# Mineralogical Analysis and TOC

## X-Ray Diffraction (XRD)

- Measure the mineral composition
- Quantify minerals present
- Sampling
  - Upper Bakken: UB-0, UB-3, UB-8, UB-16, UB-30, and UB-60
  - Lower Bakken: LB-0, LB-3, LB-8, LB-16, LB-30, and LB-60

## Total Organic Carbon (TOC)

- Measure TOC content
- Determine the kerogen type
- Determine maturation stage.

# Gas Adsorption

## Nitrogen (N<sub>2</sub>) Adsorption

- Determine
  - Pore structure distribution
  - Pore size
  - Pore diameter
  - Pore volume
  - Surface area

## Fractal Analysis

- Characterize the properties of complex structure
- Using Frenkel–Halsey-Hill (FHH)

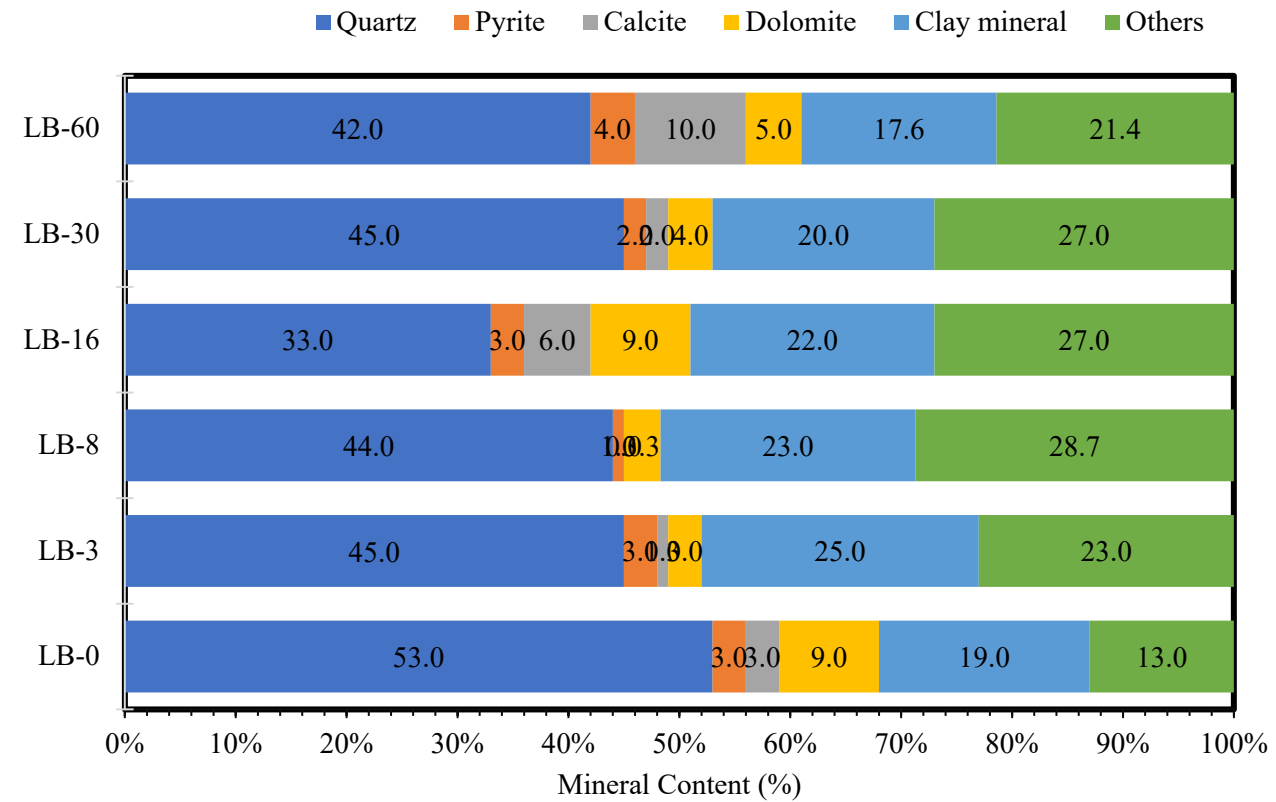

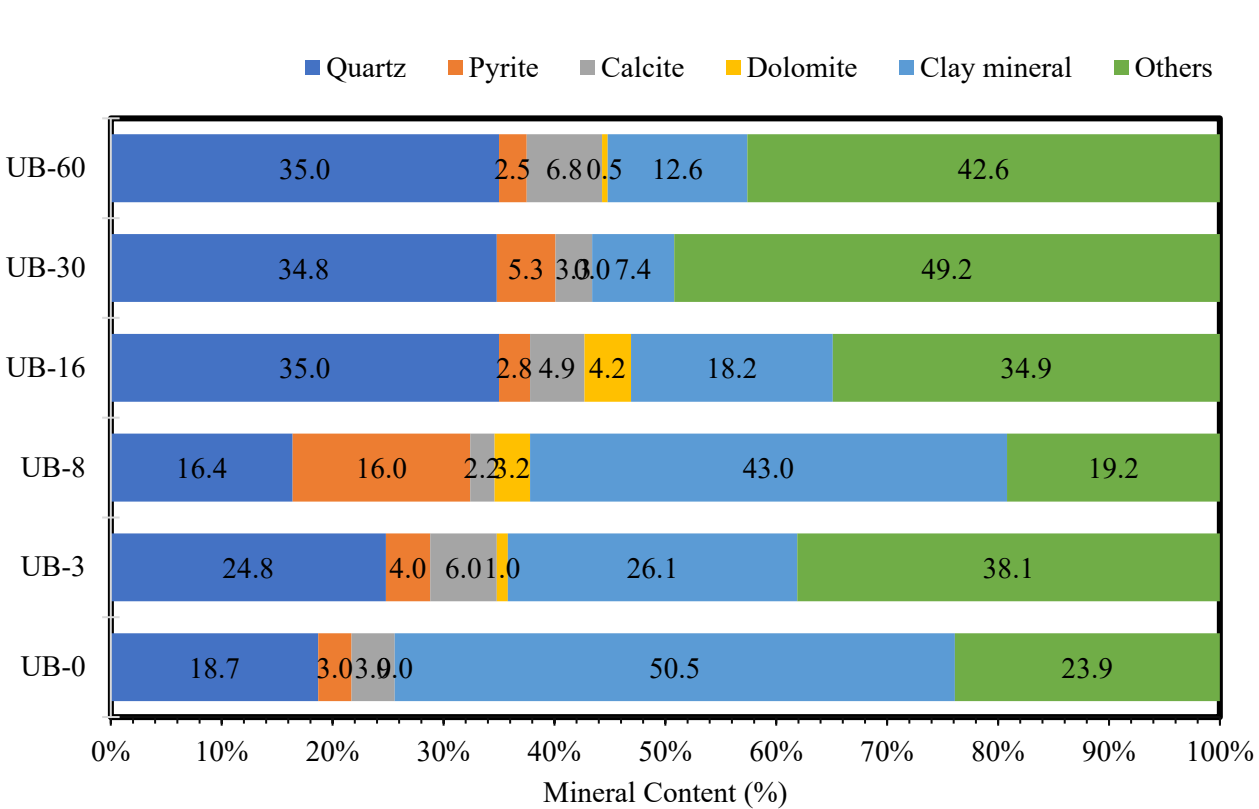

# RESULTS

# Mineralogy

CO <sub>2</sub> Exposure days	Name	Quartz	Pyrite	Calcite	Dolomite	Clay Minerals <sup>⊥</sup>	Others	TOC%	T <sub>max</sub> °C
0 day	UB-0	18.7	3.0	3.9	0.0	50.5	23.9	13.3	449.0
0 day	LB-0	53.0	3.0	3.0	9.0	19.0	13.0	14.4	448.0

<sup>⊥</sup>Clay minerals: illite + kaolinite+chlorite

■ Quartz ■ Pyrite ■ Calcite ■ Dolomite ■ Clay mineral ■ Others

Sample	Quartz (%)	Pyrite (%)	Calcite (%)	Dolomite (%)	Clay mineral (%)	Others (%)
LB-60	42.0	4.0	6.0	0.0	17.0	31.0
LB-30	45.0	2.0	0.0	0.0	27.0	28.0
LB-16	33.0	6.0	2.0	2.0	27.0	30.0
LB-8	44.0	0.0	3.0	0.0	28.7	24.3
LB-3	45.0	3.0	5.0	0.0	23.0	24.0
LB-0	53.0	3.0	0.0	0.0	33.0	11.0

■ Quartz ■ Pyrite ■ Calcite ■ Dolomite ■ Clay mineral ■ Others

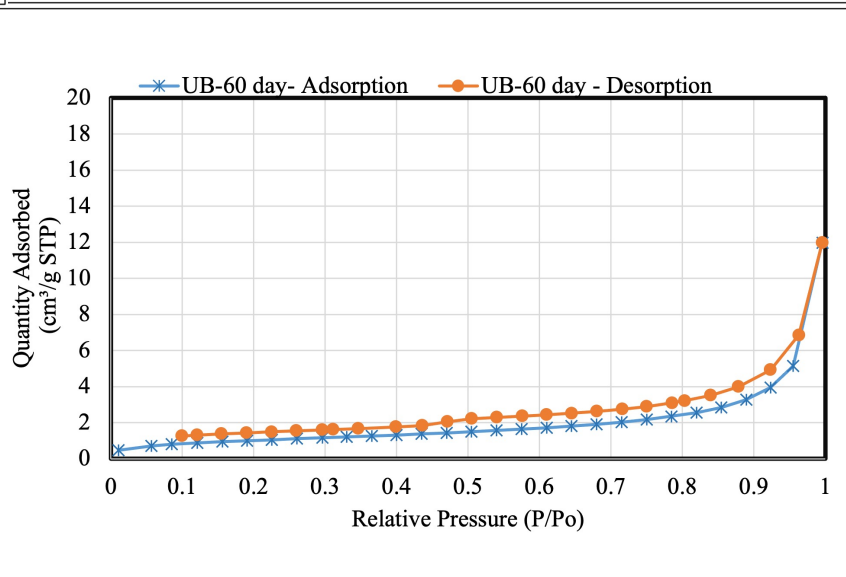

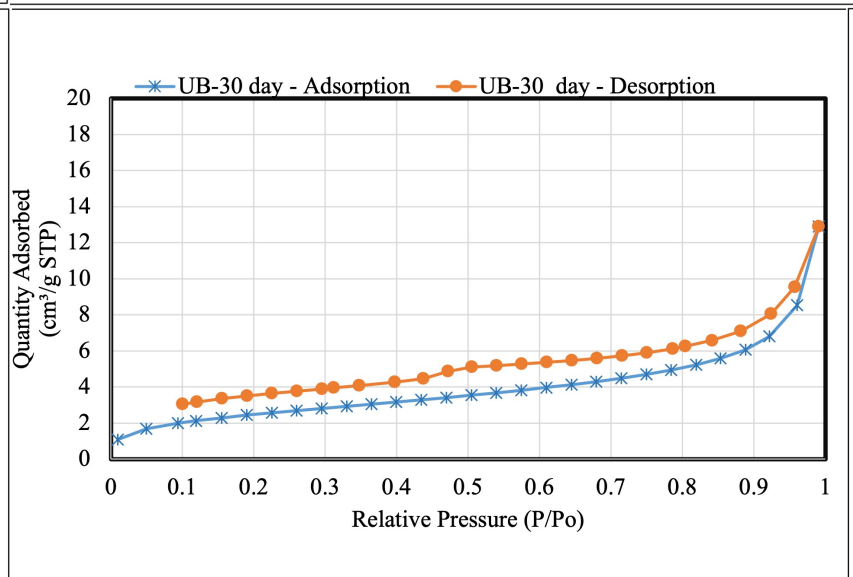

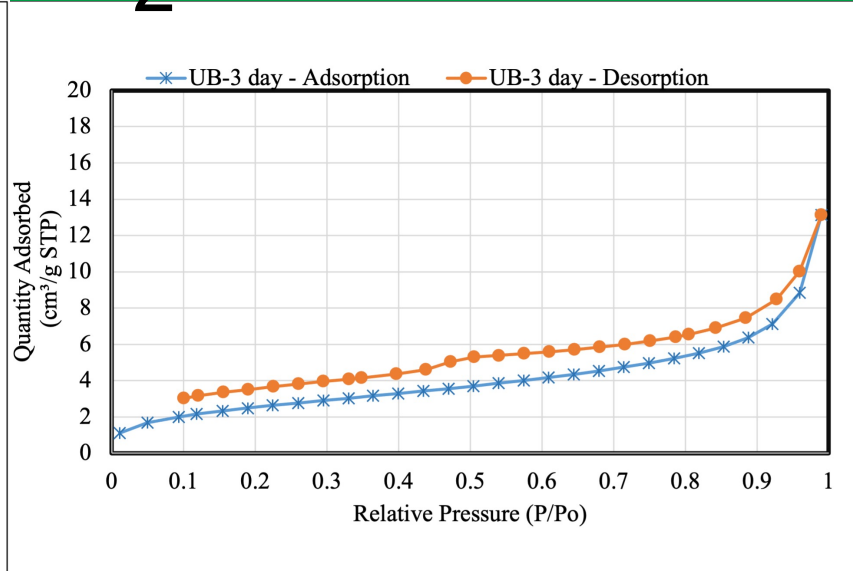

Sample	Quartz (%)	Pyrite (%)	Calcite (%)	Dolomite (%)	Clay mineral (%)	Others (%)
UB-30	35.02	3.8	0.0	0.0	12.6	48.6
UB-8	34.85	0.0	0.0	0.0	49.2	16.0
UB-0	35.02	4.9	0.0	0.0	28.2	31.9

# Dissolution and precipitation of minerals

# Lower Bakken N<sub>2</sub> Isotherm

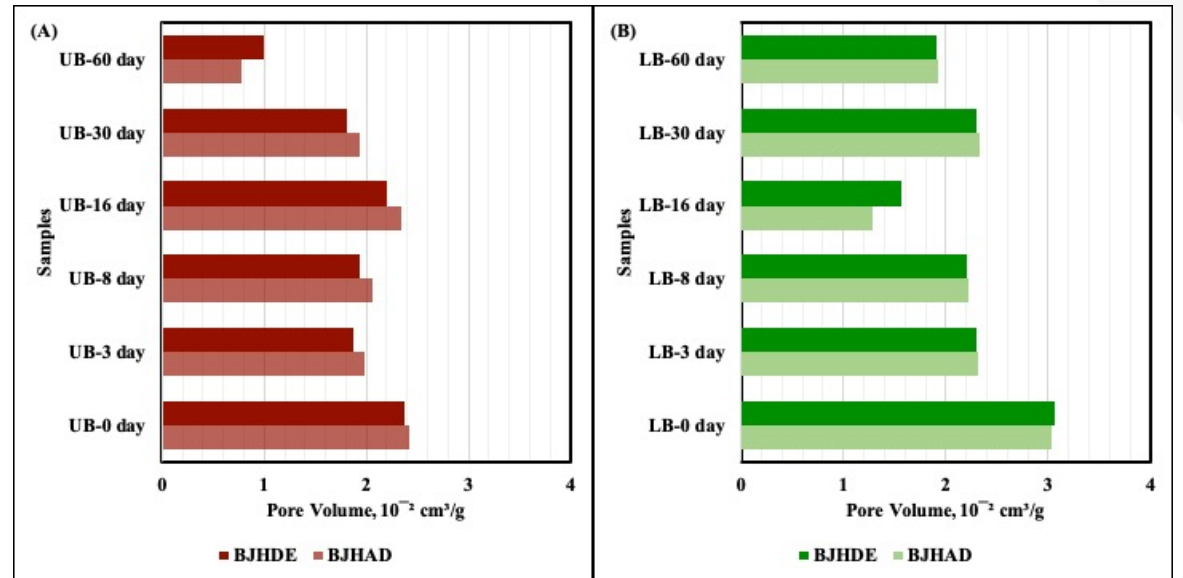

# Pore Structure Analysis

# DISCUSSION

Weak positive linear correlation

Weak positive linear correlation

Weak negative linear correlation

# Discussion

- The UB shale sample has larger quantities of clay minerals and carbonates compared to LB, while LB shale sample has more quartz.
- This explains why the LB has a larger pore volume and pore size as a result of the exposure to CO<sub>2</sub> causing the dissolution of the clay minerals and carbonates
- Larger adsorption capacity in the LB sample was to some extent related to the pore size, pore volume, mineral composition and TOC of the sample.
- Carbonate dissolution will increase the pore size of the shale samples, so the dissolution of carbonate exhibits a positive relationship with the increase in pore volume and the overall adsorption potential of the samples

# CONCLUSION

# Conclusion

- The presence of quartz seems to be playing a role in the pore size structure of the shale sample.
- The dissolution of organic matter or clay minerals in the shale after CO<sub>2</sub> saturation causes some of the pores to disappear or convert, thereby increasing and decreasing specific surface area
- Surface area is larger in the sample with larger TOC
- The fractal dimension increased as samples were saturated with CO<sub>2</sub> with peak after 8 and 16 days and decreased at 30 and 60 days for both UB and LB samples.
- Pore morphology transformation from regular to complex (dissolution) and back to more homogenous structure (precipitation).
