

# Utility Efforts to Promote Energy Efficiency

Global Energy Efficiency Workshop  
March 6-13, 2010

# Outline

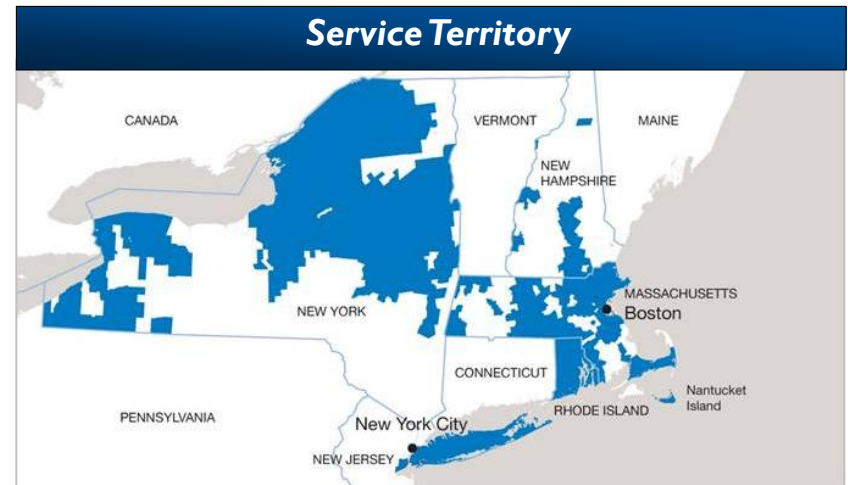

---

- ▶ Overview of National Grid USA
- ▶ Background on Energy Efficiency in Massachusetts
- ▶ Program Planning and Approval Process
- ▶ Benefit/Cost Analysis
- ▶ 2010 Program Budget
- ▶ Program Design Goals
- ▶ Program Overview
- ▶ Final Thoughts

# Overview of National Grid USA

---

- ▶ One of the largest investor owned energy companies in the world
  - ▶ \$24 billion market cap
- ▶ US operations include:
  - ▶ 4.4 million electric customers\*
  - ▶ 3.4 million gas customers
  - ▶ 4,200 MW of fossil fired generation under contract to LIPA

- ◆ Corporate Responsibility

- ◆ Commitment to reduce company-wide greenhouse gas emissions by 80% by 2050
- ◆ Rated as a “Platinum Company” in the Business in the Community 2006 Corporate Responsibility Index and a “Global Top 10” company out of those with significant global operations

\* Includes 1.1 million customers of the Long Island Power Authority served under a long-term service contract

---

# Background on Energy Efficiency Efforts

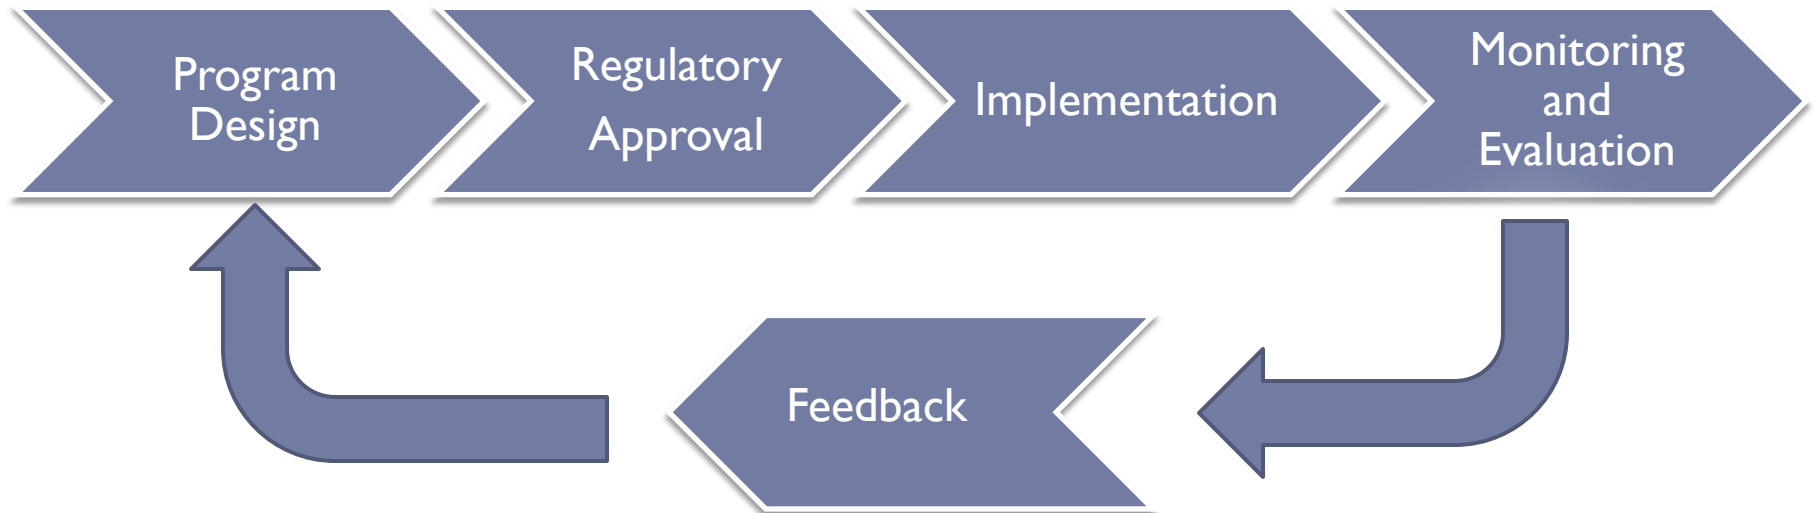

---

- ▶ National Grid first initiated large-scale energy efficiency programs in the late 1980's
- ▶ Massachusetts electric subsidiary has been expanding and improving these programs consistently over time
- ▶ Through 2009, utilities in Massachusetts invested \$3 billion and delivered 90 thousand GWh of energy savings
- ▶ In 2008, Massachusetts enacted legislation to significantly ramp up energy efficiency efforts
  - ▶ Aggressive efforts make efficiency the “First Fuel”
  - ▶ Intent is to capture all energy efficiency opportunities that are cheaper than buying power from power plants
  - ▶ Expect to meet 30% of 2020 energy needs through efficiency
  - ▶ Utilities and other stakeholders are working together through a new Energy Efficiency Advisory Council
  - ▶ Program funding has been expanded – System benefits charges, carbon allowance auction proceeds, and regional energy market revenues
  - ▶ More than \$1 billion to be invested over the next three years
  - ▶ For full plan, see: <http://www.ma-eeac.org/docs/DPU-filing/ElectricPlanFinalOct09.pdf>

# Energy Efficiency Planning and Approval Process

---

- Programs are designed and approved in a multi-step process
- Current plans are developed jointly with other utilities and interested parties
- Regulator has recently approved a three year plan for the period 2010 thru 2012
- Monitoring and evaluation results inform program design and support shareholder incentive calculation

# Benefit Cost analysis determines program offerings

---

## Benefits

- ▶ Value of energy savings
- ▶ Electric system benefits

## Costs

- ▶ Implementation costs
- ▶ Evaluation costs
- ▶ Rebates
- ▶ Shareholder incentives
- ▶ Taxes
- ▶ Customer costs

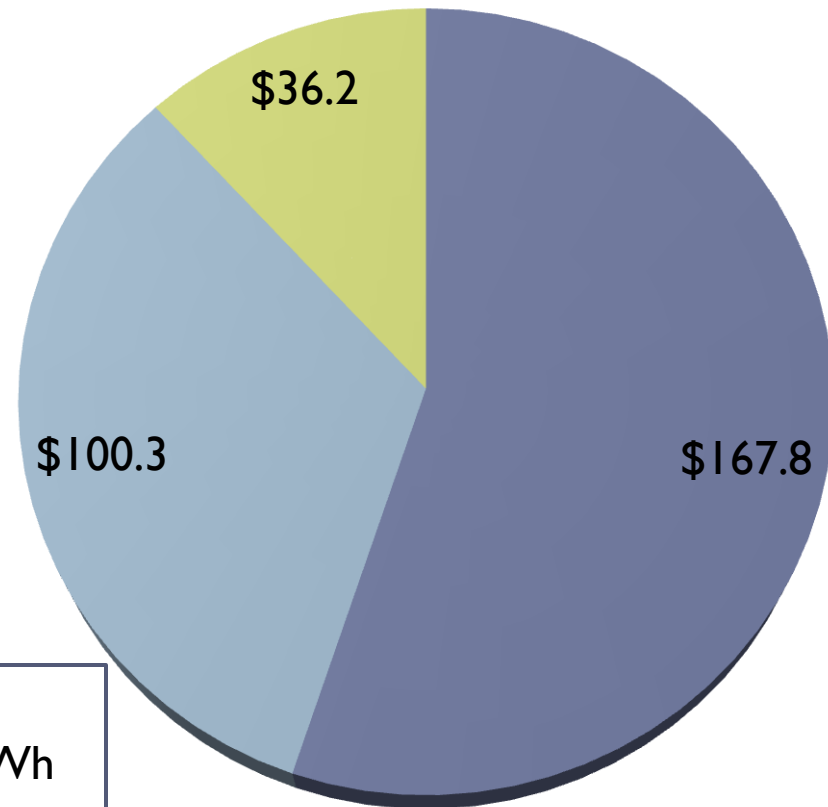

- Benefit/Cost Ratio is calculated over the useful life of the energy efficiency measure
- Overall, BCR for MA 2010 program is 3.53
  - Individual programs range from 6.56 (C&I New Construction) to 1.24 (Residential Cooling and Heating Equipment)

# Massachusetts Program Budget (2010)

---

**Millions of Dollars**

- Commercial and Industrial
- Residential
- Low-income

Total Budget \$302.3 million  
Lifetime Energy Savings 7,407,176 MWh  
Average cost: \$.04081 per kWh

# Massachusetts Budget by Component

Millions of Dollars

- Rebates
- Technical Assistance
- Program Administration
- Shareholder Incentive
- Evaluation
- Marketing
- Lost Base Revenue

Total Budget \$302.3 million  
Lifetime Energy Savings 7,407,176 MWh  
Average cost: \$.04081 per kWh

# Program Design Goals

---

- ▶ Avoid lost opportunities
- ▶ Provide a simple application process
- ▶ Serve all customer classes
- ▶ Efficient delivery
- ▶ Provide verifiable savings
- ▶ Transform markets

# Program Overview

---

- Programs are designed to reach each customer class
  - All customers contribute to the cost of the program
- Much of the focus is on new construction and major renovation
  - Incremental costs are lower in these cases
  - Failure to reach these projects results in “Lost Opportunities”
- Rebate amounts can be determined in advance (prescriptive) or on a case by case basis (custom)

Market	Target		Rebate Type	
	New Const.	Retrofit	Prescriptive	Custom
Residential	✓	✓	✓	
Small C&I		✓	✓	
Large C&I	✓	✓	✓	✓

# Residential program

---

- ▶ Target end uses include:
  - ▶ Building shell measures
  - ▶ Duct and air sealing
  - ▶ HVAC quality installation
  - ▶ Energy Efficient lighting
- ▶ Programs delivered through:
  - ▶ Retailers
  - ▶ Builders
  - ▶ Program Vendors
  - ▶ Trained contractors
- ▶ Close collaboration on low-income household program with local Community Action Program agencies

# Small Commercial and Industrial program

---

- ▶ Program criteria
  - ▶ Under 200 kW load
- ▶ “Hassle-free” for customers
  - ▶ Customer signs contract
  - ▶ Company selected vendor installs energy efficiency equipment
  - ▶ Company pays for 70% of cost
  - ▶ Customer has option to spread 30% cost share over 24 months on electric bill, with no interest
- ▶ Vendors selected through competitive bidding process
- ▶ Pre and Post installation inspections at 20 to 30% of jobs

# Large Commercial and Industrial program

---

- ▶ Available to all commercial and Industrial customers
  - ▶ Municipal customers receive higher rebates
- ▶ Marketed by Company employees
- ▶ Focus on New construction and Major retrofits
  - ▶ New construction rebates up to 70% of equipment cost (1.5 year payback)
  - ▶ Major retrofit rebates up to 50% of equipment costs (2 year payback)
- ▶ Two approaches to rebates
  - ▶ Prescriptive – savings and rebates predetermined; must install approved equipment
  - ▶ Custom – engineering analysis of energy savings; work with customer's design firm and vendors
- ▶ Only measures exceeding local codes and standards subsidized
- ▶ Pre and post installation audits

# Need to monitor rebates over time\*

---

## Standard Incandescent

Retail Price	\$1.00
Net Cost	\$1.00

## Compact Fluorescent

Retail Price	\$5.00
Less Rebate	<u>-\$4.00</u>
Net Cost	\$1.00

Properly designed subsidies can remove market barriers

# Need to monitor rebates over time\*

## Standard Incandescent

Retail Price	\$1.00
Net Cost	\$1.00

## Compact Fluorescent

Retail Price	\$5.00
Less Rebate	<u>-\$4.00</u>
Net Cost	\$1.00

Properly designed subsidies can remove market barriers

Retail Cost	<b>\$4.00</b>
Less Rebate	<u>-\$4.00</u>
Net Cost	\$0.00

Subsidies can become uneconomically large as market prices change

# Final thoughts

---

- ▶ Programs in Massachusetts have become more comprehensive and sophisticated over time
- ▶ Lighting retrofits can provide quick wins
  - ▶ “Low hanging fruit”
- ▶ Building code and appliance efficiency upgrades can help transform the market
- ▶ Over time, there will be more emphasis on alternative ways to finance energy efficiency
  - ▶ Market based solutions
  - ▶ More third party involvement
- ▶ More opportunities exist to consolidate gas and electric efficiency efforts
